AMENDMENT TO THE CLAIMS

1. (Withdrawn) A method for insitu minimization of infiltration and exfiltration of underground pipes comprising the following steps:
 - a) forming an elastically coilable and radially expandable support having a diameter when in a relaxed state;
 - b) coiling the support to a reduced diameter under tension;
 - c) inserting the tensioned coiled support into an interior annulus of a pipe where a first inner surface of the pipe wall has a diameter smaller than the outer diameter of the support in a relaxed state;
 - d) releasing the tension of the support when at a selected location; and
 - e) expanding the outer diameter of the support to contact the inner surface of the pipe wall forming the interior pipe diameter.
2. (Withdrawn) The method of claim 1 further comprising the step of incorporating a thermally responsive material with the support.
3. (Withdrawn) The method of claim 2 further comprising the step of impregnating the support with the thermally responsive material.
4. (Withdrawn) The method of claim 1 comprising the step of incorporating a partially cured thermally responsive material.
5. (Withdrawn) The method of claim 4 further comprising the step of impregnating the support with the partially cured thermally responsive material.
6. (Withdrawn) The method of claim 1 further comprising the step of incorporating an electrical conductor with the support with separable connections to an electrical power source.
7. (Withdrawn) The invention of claim 6 wherein the material contains electrically conductive elongated components.
8. (Withdrawn) The method of claim 7 wherein the elongated components are carbon fibers.
9. (Withdrawn) The method of claim 1 further comprising constructing the support with electrically conductive material.

Application No. 10/798,202
Richard Blackmore Filed March 8, 2004
GAU1733

10. (Withdrawn) The method of claim 9 further comprising constructing the support with a metal.
11. (Withdrawn) The method of claim 1 further comprising heating the support after release of tension.
12. (Withdrawn) The method of claim 9 wherein the heat is created by electrical resistivity or impedance of the support.
13. (Withdrawn) The method of claim 2 further comprising the step of pressing the thermally reactive material into surficial voids and undulations of the first inner pipe wall after release of tension.
14. (Withdrawn) The method of claim 4 further comprising the step of pressing the partially cured chemical reactant into surficial voids and undulations of the first inner pipe wall after release of tension.
15. (Withdrawn) The method of claim 11 further comprising the step of curing the reactant and rigidizing the support to form a solid inner layer proximate to the first inner pipe wall.
16. (Currently Amended) A method for in situ minimization of infiltration and ex-filtration of underground pipes comprising the following steps:
 - (a) forming an elastically coilable and radially expandable support having a diameter when in a relaxed state;
 - (b) coiling the expandable support to a reduced diameter under tension;
 - (c) inserting the expandable support into an interior annulus of a pipe where a first inner surface of the pipe wall has a diameter smaller than the outer diameter of the expandable support in a relaxed state;
 - (d) releasing the tension of the expandable support when at a selected location;
 - (e) expanding the outer diameter of the expandable support to contact the inner surface of the pipe wall forming the interior pipe diameter; and
 - (f) injecting at least one chemical reactant into the ground to form a reaction product.

Application No. 10/798,202
Richard Blackmore Filed March 8, 2004
GAU1733

~~The method of claim 1 further comprising the use of the injecting at least one chemical reactant into the ground to form a reaction product.~~

17. (Original) The method of claim 16 further comprising the step of creating a closed cell foam reaction product.
18. (Original) The method of claim 16 wherein the reaction product reduces spaces within the ground and between the ground and a second outer pipe wall surface.
19. (Currently Amended) The invention of claim 16 wherein the chemical reactant is selected from a group consisting of a hybrid polyurethane or polyester/polyurethane blend resin, and epoxy resins combined with diluents, catalysts, blowing agents and surfactants, a acrylimide, and cementitious slurry.
20. (Currently Amended) The method of claim 16 wherein the radial expansion of the expandable support ~~relaxed material~~ minimizes the infiltration of the chemical reactant ~~or~~ and reaction product into the pipe.
21. (Withdrawn) A method for insitu minimization of infiltration and exfiltration of underground pipes having thickness between a first inner surface and a second outer surface comprising the following steps:
- Inserting into the pipe a heatable and radially expandable tensioned coil support containing thermal responsive material in communication with the ground surface;
 - releasing the tension to allow an outer surface of the support to press the to the first inner surface of the pipe;
 - Injecting a reactant into the ground; and
 - heating the coil to radiate heat through the thickness of the pipe to the ground proximate to the second outer surface.
22. (Withdrawn) The method of claim 21 further comprising radiating heat to create a reaction product of expanding close cell foam.

Application No. 10/798,202
Richard Blackmore Filed March 8, 2004
GAU1733

23. (Withdrawn) The method of claim 21 further comprising heating the ground proximate to the second outer surface of the pipe prior to insertion of the reactant.
24. (Withdrawn) The method of claim 21 further comprising rigidizing the thermal-responsive material while pressed to the first interior surface of the pipe.
25. (Withdrawn) The method of claim 23 further comprising shortening the cure time of the injected chemical reactant foam proximate to second outer surface is shortened.
26. (Withdrawn) The method of claim 21 further comprising removing the support after the rigidizing the thermal-responsive material.
27. (Withdrawn) The method of claim 26 further comprising the step of recoiling the support into a smaller diameter prior to removal from the pipe.
28. (Withdrawn) The method of claim 21 further comprising placing a radially inward tensioned support on the second outer pipe wall surface.
29. (Withdrawn) The method of claim 28 further comprising the injecting a thermally responsive material into the pipe wall between the radially inward tensioned support and the inner radially expandable tensioned support.
30. (Currently Amended) An in situ [[A]] method of repairing defects in the wall of a fluid conveying pipe positioned in the ground comprising the steps of:
- (a) Impregnating a tensionable and expandable support with a thermally responsive material ~~chemical reactant~~;
 - (b) tension winding the expandable impregnated support to a reduced diameter while the thermally responsive material ~~reactant~~ is in a partially cured state;
 - (c) Inserting the tension wound expandable support ~~material~~ into a interior annulus of a pipe having an interior diameter smaller than the expandable expanding outer diameter of the tension wound expandable support ~~material~~;
 - (d) releasing the tension of the expandable support ~~impregnated wound material~~ when at a selected location proximate to the pipe defect;

Application No. 10/798,202
Richard Blackmore Filed March 8, 2004
GAU1733

- (e) expanding the outer diameter of the expandable support repair device to contact the inner surface of the pipe wall forming the interior pipe diameter; and
 - (f) injecting a chemical reactant into the ground to form a reaction product;
and
 - (g) completing the cure of the impregnated thermally responsive material chemical reactant.
31. (Currently amended) The method of claim 30 comprising the further steps of:
- (a) ~~using a heat responsive chemical reactant;~~ incorporating electrically conductive materials into the expandable support;
 - (b) attaching ~~separable~~ electrically conductive connectors means to the expandable support in communication with a electrical power source;
 - (d) conducting electric current through the conductive material within the impregnated expandable support to create heat;
 - (e) using the heat to complete the cure of the thermally responsive material chemical reactant; and
 - (f) detaching the electric power connectors from the ~~tension-wound~~ expandable support material.
32. (Currently amended) The method of claim 30 wherein the thermally responsive material ~~chemical reactant~~ is at a B stage at the time of insertion into the pipe.
33. (Currently amended) The method of claim 30 wherein the thermally responsive material ~~chemical reactant~~ is an ester.
34. (Withdrawn) A method of repairing defects in the wall of a fluid conveying pipe comprising the steps of:
- a. Impregnating a chemical reactant into a tensionable and radially compressible coiled support with a annular diameter;
 - b. tension un-winding the impregnated support around an outer pipe wall having a larger diameter while the chemical reactant is in a partially cured state;

Application No. 10/798,202
Richard Blackmore Filed March 8, 2004
GAU1733

- c. releasing the tension of the impregnated wound material when at a selected location proximate to the pipe defect; and
- d. completing the cure of the chemical reactant after removing the tensioned force expanding the annular diameter of the support.

35 through 44 (Cancelled)

- 45. (New) The invention of claim 30 wherein the chemical reactant comprises a hybrid polyurethane or polyester/polyurethane blend resin.
- 46. (New) The invention of claim 30 wherein the chemical reactant comprises an epoxy resin.
- 47. (New) An in situ method of repairing defects in the wall of a fluid conveying pipe positioned in ground comprising the steps of:
 - (a) tension winding a coilable and expandable support to a reduced diameter wherein the expandable support comprises one or more electrically conductive fibers or wires;
 - (b) inserting the tension wound expandable support into a interior annulus of a pipe having an interior diameter smaller than the expandable outer diameter of the expandable support;
 - (c) releasing the tension of the expandable support when at a selected location proximate to a pipe defect;
 - (d) injecting a chemical reactant into the ground to form a reaction product; and
 - (e) energizing the electrically conductive fiber or wire with electrical current.
- 48. (New) The method of claim 47 wherein the chemical reactant comprises a hybrid polyurethane or polyester/polyurethane blend resin.
- 49. (New) The method of claim 47 wherein the chemical reactant comprises an epoxy resin.
